

NATIONAL ADVISORY-

The Food and Drug Administration (FDA) and the Environmental Protection Agency (EPA) are advising women who are pregnant or may become pregnant, nursing mothers, and young children to avoid eating fish that contain high levels of mercury, such as:

- shark
- swordfish
- king mackerel
- tilefish

Up to 12 ounces (two average meals) a week of a variety of fish and shellfish can be eaten. The most commonly eaten fish that are low in mercury are:

- shrimp
- canned light tuna
- salmon
- pollock
- catfish

Another commonly eaten fish, albacore ("white") tuna, has more mercury than canned light tuna. Up to six ounces (one average meal) of albacore tuna can be eaten

UPPER ENTERPRISE RESERVOIR

Rainbow Trout Fish Consumption Advisory

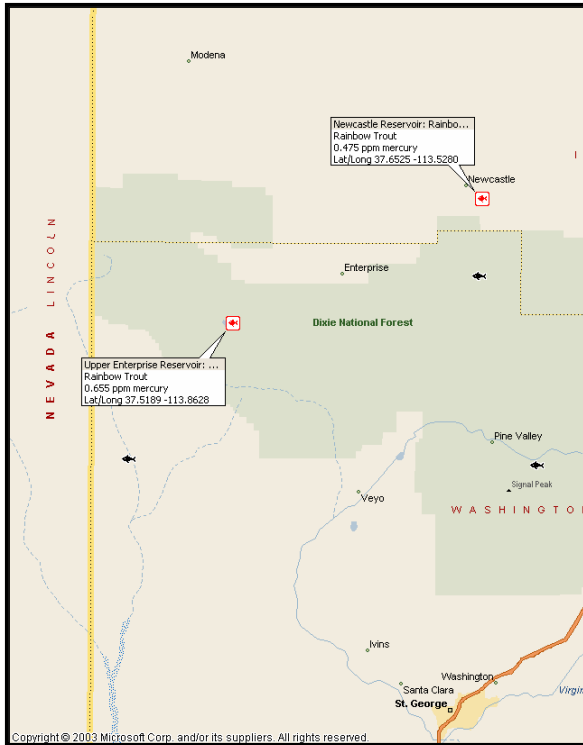

Contaminated fish may not look,
smell or taste different, but they
can still be harmful.

www.health.utah.gov/enviroepi

Upper Enterprise Reservoir: Fish Consumption Advisory for Rainbow Trout

UPPER ENTERPRISE-

WARNING:

High levels of mercury have been found in Rainbow Trout from Upper Enterprise Reservoir

ADVISORY-

Due to high mercury levels found in **Rainbow Trout** from Upper Enterprise Reservoir, Utah Public Health Officials recommend that:

- **Adults eat no more than one 8-ounce serving of these fish per month.** (An 8-ounce serving of fish is approximately the size of two decks of cards).
- **Pregnant women, nursing mothers, and children under the age of 12 should NOT eat these fish**

No known mercury related illnesses have been associated with eating the Rainbow Trout in Upper Enterprise Reservoir.

MERCURY-

Mercury occurs naturally in the environment and can also be released into the air through industrial pollution. Once released into the air, mercury can travel long distances and can build up in bodies of water. Fish absorb the mercury as they feed in polluted waters. Over time the amount of mercury in fish builds up. Mercury builds up more in some types of fish and shellfish than others, depending on what the fish eat.

Did You Know?

Preparation techniques such as cooking, smoking, curing, and freezing **do not** reduce the health hazards from mercury in the fish.

BENEFITS OF FISH-

It is important to consider the benefits of eating fish as part of a balanced diet.

Fish are an excellent source of:

- protein
- vitamins
- minerals

Fish contain low levels of unsaturated fats (e.g., omega-3 polyunsaturated fatty acids) and have been associated with a reduced risk of heart disease.

The American Heart Association recommends two servings of fish per week as part of a healthy diet.
